

Iran Lake Asphalt

Iran Lake Asphalt is a natural bitumen with high bitumen content and optimum softening point and with outstanding price competitiveness it is a perfect substitute for Trinidad Lake Asphalt for international consumers.

Lake asphalt can be used directly into the hot mix and the operating temperature is around 150 degrees Celsius for the product to fully melt and release its bitumen content into the mix.

Lake asphalt is also commonly used in making sealants and additives since it maintains a high carbon content even though lake asphalt ashes include a high mineral content (ash content). This will assist proper bonding with any carbonic materials including bituminous materials.

While the low softening point increases energy advantages, it also makes the long distance transportation difficult. **Zista Gilsonite supplies Lake Asphalt in powder form for most economical transport and inside meltable bags than can resolve in 170 degrees** in order to avoid any environmental hassles to provide even a more economical package while having a lower FOB price than Trinidad Lake Asphalt.

Zista Group supplies various Gilsonite grades under the brand of **ZITUMEN** worldwide while guarantying the aspects of quality for each shipment. Our Lake Asphalt has been tested and approved in European countries and **we can offer much economical product comparing to other Gilsonite suppliers of other origin including Trinidad Lake Asphalt** and US Suppliers.
